

MISTRAL

PRODUCT CARE GUIDE

THANK YOU FOR CHOOSING MISTRAL

MISTRAL solid surface worktops are easy to clean and maintain. By following these simple care instructions, your worktops can be preserved, and your kitchen will retain that 'just installed' look throughout its life.

CARING FOR MISTRAL WORKTOPS

General Cleaning

To remove day to day grease and grime, use a damp cloth to remove any loose items/food debris. Shake the bottle thoroughly and spray the Solid Surface Cleaner directly onto the worktop, wipe and rinse the surface using a clean damp cloth and then buff dry using a Microfibre cloth.

If any surface spills have been allowed to dry and are not removed, a second application may be required.

Protecting the Surface

Although Mistral surfaces are completely nonporous, it is still recommended that any spills are wiped up as soon as they occur. Any dried-on spills can always be removed, but the longer they are left, the less easy they are to remove.

To help with this, our Solid Surface Guard should be applied to the surface on a weekly basis which creates an imperceptible barrier on the surface.

Shake the bottle thoroughly and apply a fine mist onto the surface. Evenly distribute it over the entire area using a Microfibre cloth and then thoroughly buff dry using a clean microfibre cloth.

LIVING WITH MISTRAL WORKTOPS

Never cut objects directly on your MISTRAL worksurface, always use a cutting board/ worktop saver.

Avoid sliding hard and rough objects across the worktop surface, especially those with unglazed ceramic bases as ceramic is extremely hard and abrasive and will most likely scratch the surface.

Darker colours will show general surface wear more readily than lighter colours. This is because surface grazes and scratches on any solid surface products appear white and as a result are more noticeable.

Limescale build up over time can easily be removed using products such as Viakal® or similar. Always follow the manufacturer's instructions of use on the bottle.

Avoid exposing your MISTRAL surface to strong chemicals such as oven cleaners, drain unblockers, paint removers etc.

MISTRAL worktops have been developed to offer high levels of fire safety and cope well with heat. However, as with all worktop materials, intense heat can damage or crack the surface.

Never place any objects directly from a heat source onto your MISTRAL surface.

Do not place hot pans, dishes or heat generating appliances directly onto the surface.

Always use head pads, mats or trivets with rubber feet in any of these situations in order to protect the surface.

Make sure that pans do not overhang the edge of the hob. Deflection of heat directly onto the worktop and surrounding surfaces, such as upstands and splashbacks can cause scorching.
